### EBV

A brief explanation...

Eight week weight

The breeding potential for lamb growth rates from birth to 8 weeks of age.

Mature size

Choosing animals with high figures for this trait will increase mature size.

Litter size

Selection on high EBVs will increase the prolificacy of female replacements.

Maternal ability

This is the maternal component of the 8-week measurement. The higher this figure the better a ram's ewe lambs will perform as mothers (i.e. milking ability).

Scan weight

The breeding potential for lamb growth rates to 21 weeks (age at scanning). The selection of breeding stock with high scan weight EBVs will result in animals with heavier carcasses at a constant fat class or leaner carcasses at a constant age.

Muscle depth

Choosing animals with high muscle depth EBVs will increase lamb musculature and hence the lean meat content of the carcass.

Fat depth

Negative values indicate animals with lower fat content which will produce leaner carcasses or which can be taken to higher weights without becoming over-fat.

Lean weight

Breeding value predicting yield of lean meat in the carcass (EBV only produced for breeds involved in CT scanning).

Fat weight

Breeding value predicting yield of fat in the carcass (EBV only produced for breeds involved in CT scanning).

Gigot

Breeding value highlighting animals with superior breeding potential for gigot shape (EBV only produced for breeds involved in CT scanning).

FEC

Breeding potential for worm resistance, a negative number being preferable (EBV only produced for breeds involved in FEC sampling).

Index

Highlights superior breeding stock for a specific breeding objective.
